Consider a balloon floating in the air. See sketch. There is a string tied to the balloon. The string has a weight of $W_{string}$, and a length $L$.

Define the following set of symbols.

$V_b =$ Volume of the balloon.
$W_b =$ Weight of the balloon.
$W_{He} =$ Weight of the helium within $V_b$.
$W_{air} =$ Weight of the air in a volume $V_b$.
$h =$ Length of the part which is in the air.

Choose the correct relation (neglect the string volume)

A) $W_{air} = W_{He} + W_{string} \left( \frac{h}{L} \right)$.
B) $W_{He} = W_b + W_{string}$.
C) $W_{air} = W_b + W_{He} + W_{string}$.
D) $W_{air} = W_b + W_{He} + W_{string} \left( \frac{h}{L} \right)$.
Apply Archimedes’ principle.

The buoyant force equals to $W_{air}$, which lifts the weight of the portion of the object, which floats in the air.

Answer D
