Survey the Hamiltonian and dissipative structure of plasma models. Describe uses: model consistency, stability, and computation. Two methods GEMPIC a Poisson integrator and simulated annealing/metriplectic relaxation for MHD equilibria.
Hamiltonian and Metriplectic Descriptions of Plasma and other Matter

Philip J. Morrison

Department of Physics and Institute for Fusion Studies
The University of Texas at Austin, Austin, TX, 78712, USA
morrison@physics.utexas.edu

Physical models that describe the dynamics of matter, whether they be discrete, like those for interacting particles or dust, or continuum models, like those for fluids and plasmas, possess structure. The structure may be of Hamiltonian type (see [1, 2] for review) and/or posses dissipation and exhibit metriplectic structure [3] (see [4] for review). The structure may give rise to conservation laws resulting from Galilean, Poincare, or other invariance, or it may assure the property of entropy production giving relaxation to thermal equilibrium. On a basic level, all structure ultimately arises from an underlying Hamiltonian form that may or may not be maintained in approximations and/or reductions of various kinds.

I will survey the structure and its uses for a variety of models, with an emphasis on general magnetofluid models [5, 6, 7, 8, 9, 10, 11] and Vlasov-Maxwell theory [1, 12]. In particular, I will discuss structure preserving numerical algorithms and how structure can be used to design algorithms for specific purposes [13, 14, 15, 16]. Although symplectic integration has been well studied and widely used for finite-dimensional systems, the preservation of the structure that occurs in continuum models such as extended magnetohydrodynamics with generalized helicities, is considerably more difficult to implement. Progress in developing a discrete version of the Maxwell-Vlasov system that preserves its Hamiltonian structure, and its numerical implementation will be discussed [14].

Overview

A Survey of

- Hamiltonian Structure of Ideal Plasma Dynamics
- Metriplectic Dynamics of Dissipative Plasma Dynamics
- Structure Preserving Computation

For long list of references see abstract.
Hamilton’s Equations

Phase Space with Canonical Coordinates: \((q, p)\)

Hamiltonian function: \(H(q, p)\) ← the energy

Equations of Motion:

\[
\dot{p}_i = -\frac{\partial H}{\partial q^i}, \quad \dot{q}^i = \frac{\partial H}{\partial p_i}, \quad i = 1, 2, \ldots N
\]

Phase Space Coordinate Rewrite: \(z = (q, p), \quad \alpha, \beta = 1, 2, \ldots 2N\)

\[
\dot{z}^\alpha = J_c^{\alpha\beta} \frac{\partial H}{\partial z^\beta} = \{z^\alpha, H\}, \quad (J_c^{\alpha\beta}) = \begin{pmatrix} 0_N & I_N \\ -I_N & 0_N \end{pmatrix},
\]

\(J_c := \text{Poisson tensor}, \text{ Hamiltonian bi-vector, cosymplectic form}\)

symplectic 2-form = (cosymplectic form)\(^{-1}\): \(\omega_c^{\alpha\beta} J_c^{\beta\gamma} = \delta^\gamma_\alpha,\)
Noncanonical Hamiltonian Dynamics

Sophus Lie (1890)

Noncanonical Coordinates:

\[ \dot{z}^\alpha = J^{\alpha\beta} \frac{\partial H}{\partial z^\beta} = \{ z^\alpha, H \}, \quad \{ f, g \} = \frac{\partial f}{\partial z^\alpha} J^{\alpha\beta}(z) \frac{\partial g}{\partial z^\beta}, \quad \alpha, \beta = 1, 2, \ldots M \]

Poisson Bracket Properties:

antisymmetry $\rightarrow \{ f, g \} = -\{ g, f \}$,

Jacobi identity $\rightarrow \{ f, \{ g, h \} \} + \{ g, \{ h, f \} \} + \{ h, \{ f, g \} \} = 0$

G. Darboux: $\det J \neq 0 \implies J \rightarrow J_c$ Canonical Coordinates

Sophus Lie: $\det J = 0 \implies$ Canonical Coordinates plus Casimirs

\[
J \rightarrow J_d = \begin{pmatrix}
0_N & I_N & 0 \\
-I_N & 0_N & 0 \\
0 & 0 & 0_{M-2N}
\end{pmatrix}.
\]
Degeneracy in $J \Rightarrow$ Casimirs:

$$\{f, C\} = 0 \quad \forall \ f : \mathcal{M} \to \mathbb{R}$$

Lie-Darboux Foliation by Casimir (symplectic) leaves:

Leaf vector fields, $Z_f = \{z, f\} = Jdf$ are tangent to leaves.
Noncanonical Poisson Brackets

- All nondissipative (correct!) plasma models have them:
  Ideal fluid flow, two-fluid theory, MHD, shearflow, variety of reduced fluid models, extended MHD, Vlasov-Maxwell, BBGKY, etc.

\[ \{ f, g \} = \frac{\partial f}{\partial z^\alpha} J^{\alpha\beta}(z) \frac{\partial g}{\partial z^\beta} \rightarrow \]

\[ \{ F, G \} = \int d\mu \frac{\delta F}{\delta \psi} J(\psi) \frac{\delta G}{\delta \psi} \]

with \( J \) and operator.

For example: \( \psi = (\mathbf{v}, B, \rho, p) \) for MHD.
Magnetohydrodynamics (MHD)
MHD

Equations of Motion:

**Force**
\[ \rho \frac{\partial v}{\partial t} = -\rho v \cdot \nabla v - \nabla p + \frac{1}{c} J \times B \]

**Density**
\[ \frac{\partial \rho}{\partial t} = -\nabla \cdot (\rho v) \]

**Entropy**
\[ \frac{\partial s}{\partial t} = -v \cdot \nabla s \]

**Ohm’s Law**
\[ E + v \times B = \eta J \approx 0 \]

**Magnetic Field**
\[ \frac{\partial B}{\partial t} = -\nabla \times E = \nabla \times (v \times B) \]

Energy:
\[ H = \int_D d^3x \left( \frac{1}{2} \rho |v|^2 + \rho U(\rho, s) + \frac{1}{2} |B|^2 \right) \]

Thermodynamics:
\[ p = \rho^2 \frac{\partial U}{\partial \rho} \quad T = \frac{\partial U}{\partial s} \quad \text{or} \quad p = \kappa \rho^\gamma \]
Noncanonical Lie-Poisson Bracket (pjm & Greene 1980):

\[
\{ F, G \} = - \int_D d^3x \left[ M_i \left( \frac{\delta F}{\delta M_j} \frac{\partial}{\partial x^j} \frac{\delta G}{\delta M_i} - \frac{\delta G}{\delta M_j} \frac{\partial}{\partial x^j} \frac{\delta F}{\delta M_i} \right) \\
+ \rho \left( \frac{\delta F}{\delta M} \cdot \nabla \frac{\delta G}{\delta \rho} - \frac{\delta G}{\delta M} \cdot \nabla \frac{\delta F}{\delta \rho} \right) + \sigma \left( \frac{\delta F}{\delta M} \cdot \nabla \frac{\delta G}{\delta \sigma} - \frac{\delta G}{\delta M} \cdot \nabla \frac{\delta F}{\delta \sigma} \right) \\
+ B \cdot \left[ \frac{\delta F}{\delta M} \cdot \nabla \frac{\delta G}{\delta B} - \frac{\delta G}{\delta M} \cdot \nabla \frac{\delta F}{\delta B} \right] \\
+ B \cdot \left[ \nabla \left( \frac{\delta F}{\delta M} \right) \cdot \frac{\delta G}{\delta B} - \nabla \left( \frac{\delta G}{\delta M} \right) \cdot \frac{\delta F}{\delta B} \right] \right],
\]

Dynamics:

\[
\frac{\partial \rho}{\partial t} = \{ \rho, H \}, \quad \frac{\partial s}{\partial t} = \{ s, H \}, \quad \frac{\partial v}{\partial t} = \{ v, H \}, \quad \text{and} \quad \frac{\partial B}{\partial t} = \{ B, H \}.
\]

Densities:

\[ M := \rho v \quad \sigma := \rho s \]
Casimir Invariants

Helicities are Casimir Invariants:

\[ \{ F, C \}^{MHD} = 0 \quad \forall \text{ functionals } F. \]

Casimirs Invariants (helicities):

\[ C_B = \int d^3 x \, B \cdot A, \quad C_V = \int d^3 x \, B \cdot v \]

Topological content, linking etc.
Extended MHD (XMHD)
Ohm's Law:

\[ E + V \times B = \frac{d_e^2}{\rho} \left( \frac{\partial J}{\partial t} + \nabla \cdot (V J + J V - \frac{d_i}{\rho} J J) \right) + \frac{d_i}{\rho} \left( J \times B - \nabla p_e \right) . \]

Momentum:

\[ \rho \left( \frac{\partial V}{\partial t} + (V \cdot \nabla) V \right) = -\nabla p + J \times B - d_e^2 J \cdot \nabla \left( \frac{J}{\rho} \right) . \]

Two parameters, \( d_e = \frac{c}{\omega_{pe} L} \) measures electron inertia and \( d_i = \frac{c}{\omega_{pi} L} \) accounts for current carried by electrons mostly ... .
Energy Conservation

Candidate Hamiltonian:

\[
H = \int d^3x \left[ \rho \frac{|V|^2}{2} + \rho U(\rho) + \frac{|B|^2}{2} + d_e^2 \frac{|J|^2}{2\rho} \right]
\]

Kimura and pjm 2014 on energy conservation

\( H \) is conserved. Pressure, \( p = \rho^2 \partial U / \partial \rho \).

What is the Poisson bracket? Casimirs? Helicities?
XMHD Hamiltonian Structure

Yoshida, Abdelhamid, Kawazura, pjm, Lingam, Miloshevich, D’Avignon

Poisson Bracket:

\[
\{F, G\}^{XMHD} = \{F, G\}^{MHD} + d_e^2 \int_D d^3x \left[ \frac{\nabla \times \mathbf{V}}{\rho} \cdot \left( (\nabla \times F_{B^*}) \times (\nabla \times G_{B^*}) \right) \right] \\
+ d_i \int_D d^3x \frac{B^*}{\rho} \cdot \left( (\nabla \times F_{B^*}) \times (\nabla \times G_{B^*}) \right)
\]

where we introduce the ‘inertial’ magnetic field

\[
B^* = B + d_e^2 \nabla \times \left( \frac{\nabla \times B}{\rho} \right)
\]

Hamiltonian:

\[
H = \int_D d^3x \left[ \frac{\rho|\mathbf{V}|^2}{2} + \rho U(\rho) + \frac{\mathbf{B} \cdot \mathbf{B}^*}{2} \right]
\]
XMHD Hamiltonian Structure (cont)

Casimirs;

\[ C_{XMHD}^{\pm} = \int_{D} d^3 x \ (V + \lambda_{\pm} A^*) \cdot (\nabla \times V + \lambda_{\pm} B^*) , \]

where

\[ \lambda_{\pm} = \frac{-d_i \pm \sqrt{d_i^2 + 4d_e^2}}{2d_e} . \]

Jacobi Identity:

Directly Abdelhamid et al.; remarkable transformations Lingam et al. which lead to normal fields.
Normal Fields

Normal Fields:

\[ \mathcal{B}_\pm := B + d^2_e \nabla \times \left[ \frac{\nabla \times B}{\rho} \right] + \lambda_\pm \nabla \times V \]

XMHD remarkably yields:

\[ \frac{\partial \mathcal{B}_\pm}{\partial t} + \mathcal{L}_V \mathcal{B}_\pm = 0 \quad \leftarrow \text{Lie dragging} \quad \Rightarrow \text{2 frozen fluxes!} \]

Hamiltonian Reconnection \rightarrow Kawazura

Dragging velocities:

\[ V_\pm = V - \lambda_\mp \nabla \times B / \rho \]

Helicities:

\[ K_\pm = \int A_\pm \wedge dA_\pm, \quad \mathcal{B}_\pm = \nabla \times A_\pm \sim dA_\pm \]
Maxwell-Vlasov
Maxwell Part

\[
\frac{\partial \mathbf{B}}{\partial t} = -c \nabla \times \mathbf{E} \\
\nabla \cdot \mathbf{B} = 0
\]

\[
\frac{\partial \mathbf{E}}{\partial t} = c \nabla \times \mathbf{B} - 4\pi J_e \\
\nabla \cdot \mathbf{E} = 4\pi \rho_e
\]
Coupling to Vlasov

\[
\frac{\partial f_s}{\partial t} = -v \cdot \nabla f_s - \frac{e_s}{m_s} \left( E + \frac{v}{c} \times B \right) \cdot \frac{\partial f_s}{\partial v}
\]

\[
\rho_e(x, t) = \sum_s e_s \int f_s(x, v, t) \, d^3v, \quad J_e(x, t) = \sum_s e_s \int v \, f_s(x, v, t) \, d^3v
\]

\( f_s(x, v, t) \) is a phase space density for particles of species \( s \) with charge and mass, \( e_s, m_s \).

\[
\psi = \left( E(x, t), B(x, t), f_s(x, v, t) \right)
\]
Maxwell-Vlasov Hamiltonian Structure

Hamiltonian:

\[ H = \sum_s \frac{m_s}{2} \int |v|^2 f_s \, d^3 x \, d^3 v + \frac{1}{8\pi} \int (|E|^2 + |B|^2) \, d^3 x , \]

Bracket:

\[ \{ F, G \} = \sum_s \int \left( \frac{1}{m_s} f_s \left( \nabla F_{f_s} \cdot \partial_v G_{f_s} - \nabla G_{f_s} \cdot \partial_v F_{f_s} \right) \right. \]
\[ + \frac{e_s}{m_s^2 c} f_s \mathbf{B} \cdot \left( \partial_v F_{f_s} \times \partial_v G_{f_s} \right) \]
\[ + \frac{4\pi e_s}{m_s} f_s \left( G_E \cdot \partial_v F_{f_s} - F_E \cdot \partial_v G_{f_s} \right) \] \[ \left. \right) d^3 x \, d^3 v \]
\[ + \frac{4\pi c}{m_s} \int \left( F_E \cdot \nabla \times G_B - G_E \cdot \nabla \times F_B \right) d^3 x , \]

where \( \partial_v := \partial/\partial v \), \( F_{f_s} \) means functional derivative of \( F \) with respect to \( f_s \) etc.

pjm 1980, 1982; Marsden and Weinstein 1982
Maxwell-Vlasov Structure (cont)

Equations of Motion:

\[
\frac{\partial f_s}{\partial t} = \{f_s, H\}, \quad \frac{\partial E}{\partial t} = \{E, H\}, \quad \frac{\partial B}{\partial t} = \{B, H\}.
\]

Casimirs invariants:

\[
C^f_s[f_s] = \int C_s(f_s) \, d^3 x \, d^3 v
\]

\[
C^E[E, f_s] = \int h^E(x) \left( \nabla \cdot E - 4\pi \sum_s e_s \int f_s \, d^3 v \right) \, d^3 x,
\]

\[
C^B[B] = \int h^B(x) \nabla \cdot B \, d^3 x,
\]

where \( C_s \), \( h^E \) and \( h^B \) are arbitrary functions of their arguments. These satisfy the degeneracy conditions

\[
\{F, C\} = 0 \quad \forall F.
\]
Summary

Poisson brackets defined by $\mathcal{J}$, dynamics $\partial \psi / \partial t = \{\psi, H\}$:

\[
\begin{align*}
\mathcal{J}_{MHD} & \rightarrow \text{Casimirs} \\
\mathcal{J}_{XMHD} & \rightarrow \text{Casimirs} \\
\mathcal{J}_{V-M} & \rightarrow \text{Casimirs}
\end{align*}
\]

**Good theories** in their ideal limit $(\nu, \eta, \cdots \rightarrow 0)$ conserve energies, $H$, and have **Poisson brackets**. Bad theories do bad things: unaccounted energy, unphysical instabilities, etc.
Other Models

- **Reduced Fluid Models**: aspect ratio expansion, 4-field model, fluid models with gyroviscosity, Hall physics, etc.
  
  Hazeltine et al., Waelbroeck, Tassi, Grasso, Pegoraro et al., ...

- **Hybrid Models**: hot particle species, kinetic MHD, gyro-fluid models, etc.
  
  Tronci, Tassi, et al., Burby et al., etc. ...

**The good theories** in their ideal limit \((\nu, \eta, \cdots \to 0)\) conserve energies, \(H\), and have **Poisson brackets**. Bad theories do bad things: unaccounted energy, unphysical instabilities, etc. **Bonus**: Casimir invariants emerge.
Energy Principles

All good theories have energy principles, akin to $\delta W$ of MHD.

$$\frac{\partial \psi}{\partial t} = \{\psi, H\} = \{\psi, H + C\} = 0 \rightarrow$$

• Variational principle for equilibrium, $\delta F = \delta (H + C) = 0$
• Dirichlet energy theorem: $\delta^2 F$ definite $\Rightarrow$ stability
• Lagrange iff energy theorem: $\delta^2 F = $ Kinetic $+ $ Potential

MHD: e.g. Andreussi, et al. 2010 – 2019
XMHD: e.g. Kaltsas et al. 2019

Explains “mysterious” ad hoc discoveries over the years and leads to new results.
Dissipation and Metriplectic Dynamics
Metriplectic Dynamics

General dynamical framework making thermodynamics dynamical.

Captures:

- First Law: conservation of energy
- Second Law: entropy production

pjm, ... 1982,1984. ... Generic 1998
Prototypes and Examples

- Finite-dimensional systems: rigid body, Materassi, Tassi, ...

- Kinetic theories: Vlasov Fokker-Planck equation, Lenard-Balescu equation, etc.

- Fluid flows: various nonideal fluids, Navier-Stokes, MHD, XMHD, etc.

- Many more ...
**Entropy, Degeneracies, and 1st and 2nd Laws**

- Casimirs of $\{,\}$ are ‘candidate’ entropies. Election of particular $S \in \{\text{Casimirs}\} \Rightarrow$ thermal equilibrium (relaxed) state.

- Generator (free energy): $\mathcal{F} = H + S$

- **1st Law**: identify energy with Hamiltonian, $H$, then
  \[
  \dot{H} = \{H, \mathcal{F}\} + (H, \mathcal{F}) = 0 + (H, H) + (H, S) = 0
  \]
  Degeneracy such that $(H, f) = 0 \forall f$

- **2nd Law**: entropy production
  \[
  \dot{S} = \{S, \mathcal{F}\} + (S, \mathcal{F}) = (S, S) \geq 0
  \]
  Lyapunov relaxation to the equilibrium state: $\delta \mathcal{F} = 0$. 
Preliminaries

Entropy/volume: $\sigma(x,t)$

Density of Extensive variable: $\zeta_a(x,t)$ \quad $a = 1, 2, \ldots$

$$d\sigma = \sum_a \frac{\partial \sigma}{\partial \zeta_a} d\zeta_a =: \sum_a X^a d\zeta_a$$

$$\frac{\partial \zeta_a}{\partial t} + \nabla \cdot J_T = \sum_a J_a \cdot \nabla X^a,$$

$$J_T = \sum_a X^a J_a,$$ \quad $J_a =$ unknown flux?

Near Equilibrium Assumption:

$$J_a = \sum_b L_{ab} \nabla X^b$$

Onsager for Affinity $\nabla X^a$:

$L_{ab} = L_{ba}$ \quad $\Rightarrow$ \quad Second Law
Whence \((F, G)\)?

The Dissipative Bracket:

\[
(F, G) = \frac{1}{T} \int d^3x \nabla \frac{\delta F}{\delta \zeta_a} \cdot L_{ab}[\zeta] \cdot \nabla \frac{\delta G}{\delta \zeta_b}
\]

Natural Variable \(\varepsilon\):

\[
H = \int d^3x \varepsilon \quad \Rightarrow \quad (F, H) = 0 \quad \forall F
\]

Hamiltonian \((M, B^*, \rho, \sigma)\) vs. Metriplectic \((M, B^*, \rho, \varepsilon)\)

Onsager Pairs (Force/Flux):

- Current ↔ Temp, etc., in particular
- Viscosity ↔ Current

XMHD, Coquintot & pjm 2019
Structure and Computation

- Poisson Integrator
- Simulated Annealing
**Poisson Integrator**

**Symplectic Integrator:** $z(t) \rightarrow z(t + \delta t)$ via a canonical transformation $\Rightarrow$ volume preservation, all Poincare invariants, symplectic invariants. Energy is shadowed.

**Noncanonical phase space** (Poisson manifold):

**Poisson Integrator:**
- Exactly preserves Casimir leaf (constraint surface)
- Symplectic on each leaf.
GEMPIC

**A Poisson integrators:**

Other structure preserving: Qin +, Xiao Zhou, ... Shadwick +, etc.

Review: pjm 2017
Discretizing the Noncanonical Maxwell-Vlasov Hamiltonian Structure

- Discretize fields $f$ (particles), $E$, $B$ (finite element exterior calculus)

- Discretize Vlasov-Maxwell noncanonical Poisson bracket

- Discretize Hamiltonian $\hat{H}$

- Obtain finite-dimensional noncanonical Hamiltonian system for

  $$z = (z^1, z^2, \ldots, z^N) = (X, V, E, B)$$

  $$\dot{z}^i = \{z^i, \hat{H}\}_d$$

  with $N$ very large. Splitting method.
Simulated Annealing

**Metriplectic integrators:** For accurate collision operators, that relax to thermal equilibrium while preserving energy etc. Hirvijoki, Kraus, Burby, ...

**Relaxation by False Dynamics:** Construct system, metriplectic or other that relaxes to desired equilibrium while conserving desired quantities.
MHD equilibria: Furukawa, Bressen, Maj, ...
Geophysical Fluid Dynamics: Flierl + pjm
Underview

A Survey of

- Hamiltonian Structure of Ideal Plasma Dynamics
- Metriplectic Dynamics of Dissipative Plasma Dynamics
- Structure Preserving Computation

For long list of references see abstract.
