

## Annihilation *v.* Compton Scattering

Annihilation  $e^+e^- \rightarrow \gamma\gamma$ : 2 tree diagrams related by Bose symmetry:

Compton scattering  $\gamma e^- \rightarrow \gamma e^-$ : 2 similar tree diagrams

The annihilation and the Compton scattering are related by crossing  $s \leftrightarrow t$ , *i.e.*

$$t^a \leftrightarrow s^c, \quad s^a \leftrightarrow t^c, \quad u^a \leftrightarrow u^c. \quad (3)$$

Hence, the amplitudes of these two processes are analytic continuations of each other as functions of momenta,

$$\mathcal{M}^{\text{annihilation}} = f(s, t, u), \quad \mathcal{M}^{\text{Compton}} = f(t, s, u) \quad (4)$$

for the same analytic function  $f$ .

After summing / averaging over fermion spins and photon's polarization, we have

$$\begin{aligned} \sum_{\lambda_1, \lambda_2} \frac{1}{4} \sum_{s-, s+} \left| \mathcal{M}^{\text{annihilation}} \right|^2 &= F(s, t, u), \\ \frac{1}{2} \sum_{s, s'} \frac{1}{2} \sum_{\lambda \lambda'} \left| \mathcal{M}^{\text{Compton}} \right|^2 &= -F(t, s, u), \end{aligned} \tag{5}$$

for the same function  $F$ . The opposite signs of  $F$  in the two formulae follow from crossing an odd number of fermions. These signs are necessary to keep all the spin-summed  $|\mathcal{M}|^2$  positive.

To see where such signs come from, consider some generic process  $X \rightarrow Y$  and let

$$f(s, t, u) = \langle Y | \mathcal{M} | X \rangle, \quad \bar{f}(s, t, u) = \langle X | \mathcal{M} | Y \rangle. \tag{6}$$

For *real momenta*  $\bar{f}$  is the complex conjugate of  $f$ , but once we analytically continue to complex momenta, this is no longer true. When we continue to the crossed momenta — which are real but have negative  $p^0$  for the crossed particles — the analytic continuations of the  $f$  and the  $\bar{f}$  functions go back to being complex conjugates of each other *up to a sign*,

$$\bar{f} = f^* \times (-1)^{\#\text{FC}} \tag{7}$$

where  $\#\text{FC}$  is the number of fermions we have crossed (*i.e.*, made incoming rather than outgoing or vice versa.)
